

Introduction to Artificial Intelligence

Artificial Intelligence (AI) is the field of building systems that can perform tasks that normally require human intelligence.

Large Language Models (LLMs) are AI models trained on large amounts of text data to understand and generate language.

RAG stands for Retrieval-Augmented Generation. It combines information retrieval with language generation to provide more accurate and up-to-date answers.

RLHF stands for Reinforcement Learning from Human Feedback. It helps align model responses with human preferences.

Embeddings convert text into numerical vectors that capture semantic meaning.

LangChain is a framework used to build applications powered by large language models.

Vector databases store embeddings and enable similarity search for RAG systems.
